Why Online Synchronization script is Right for Your Business

Imagine a company with a primary database. The database is located on an in-house server. The company also has three web sites hosted on three web servers. The main server is the collective backup site for all servers in the group. The company's data administrator must schedule data updates. How will he handle it? Our script does the job for him. Our script creates a synchronized network between the main server and three web servers. As the main server gets new updates, the script delivers them the web servers. The end users see the most recent information.

Key Benefits of online synchronization scripts

1. Our script is a custom solution. You can change our script to meet specific needs. No other data synchronization software provides you with this flexibility.
2. The script we provide you is also its own unique source code. This is why we say, "Buy Once for Lifetime Use on n Computers."
3. Our script seamlessly integrates with your database and scripts. No other software integrates as easily as ours do.

Learn the Online Synchronization

1. [Synchronization](#)

Synchronization is a process which updates the one object according to requirement by source object. Like: syncing database table from other database table. There are a variety of great tools on the market that will run these comparisons, as well as perform many other functions. You don't need to go out and buy one because SQL Server comes with a tool called XML-RPC that will do this for you.

2. [Online Synchronization](#)

Online Synchronization offers powerful data solutions for individuals, professionals and businesses. These solutions allow users to have their data when and where they need it, by providing integrated online backup, online PC synchronization, secure file sharing and remote file access. So, rather than install and run many different applications or run dedicated servers - Online Synchronization gives you a one-stop solution that's simple, secure and affordable.

3. [MySQL Synchronization](#)

The Synchronization Manager enables one to set up data synchronization scenarios from one MaxDB to one or several MaxDB servers. The Synchronization Manager uses the standardized XML-RPC to enable asynchronous data transfer. An easy-to-use GUI is also included to simplify the definition of the synchronization scenarios.

The new tool also supports using a MySQL server as a write-only client. Thus, for instance SAP Application users with MaxDB, can now easily synchronize key data to a separate MySQL server for business intelligence or reporting purposes.

4. [Database Synchronization](#)

Online data synchronization is a service that provides you the ability to deliver up-to-date information between several network servers regardless of their geographic location. The data synchronization process allows updated information to migrate across different network platforms. Online data synchronization results in real-time information that is available any time you need, anywhere you need it.

Online data synchronization is a safe, effective, and cost-saving approach to data management. Online data synchronization services offer a wide range of data management solutions regardless of the size

and complexity of the data structure.

Why Data Synchronization?

Generally regular Database takes huge space in your Data Storage. Data Synchronization can help you to synchronize your data into small data file. Companies using various software for various applications because companies having various locations for Distributions or regional offices etc. These locations having different- different software connected to Head Office. Various Branch Automation Software Solutions helping companies to connect other software through Data Synconization.

5.Synchronization Scripts

We provide you with a synchronization script and you can modify it as you wish. Our synchronization script performs the synchronization function described above and gives you the option to customize a project at any time. You can easily carry out a synchronization between one and n users. You have the option to modify a project to match your current needs. The user interface with our script adds a unique function that software alone cannot perform.

6. File Synchronization

For years, you have experienced days when you have to copy your files or documents which have been changed, and then paste them into the other disks for backup, or the home computer for continuing your unfinished works. This is really bad experience, for although it seems to be routine task, you have to repeat the monotonous and tedious works every day, every hour, even less. It's indeed inconvenient, sometimes there are so many files you have changed in this case that you will make mistakes and forget to copy all changed files. The common but important task really makes you annoyed so that you have to find a way to get rid of it.

Actually, you have heard the word File Synchronization and known little about it. What's File Synchronization or File Sync? It also called File Mirroring, or File Replication. File synchronization automatically synchronizes files between two folders which may be separated in two drivers or even if in two computers, simply, i.e. copies files from one driver or computer to another.

7. RSS Synchronization

RSS is a family of Web feed formats used to publish frequently updated content such as blog entries, news headlines, and podcasts in a standardized format. An RSS document (which is called a "feed," "web feed," or "channel") contains either a summary of content from an associated web site or the full text. RSS makes it possible for people to keep up with web sites in an automated manner that can be piped into special programs or filtered displays.

A Custom Solution Online Synchronization Script.
Pay Once And Use For Life Time.

The benefit of RSS is the aggregation of content from multiple web sources in one place. RSS content can be read using software called an "RSS reader," "feed reader," or an "aggregator," which can be web-based or desktop-based. A standardized XML file format allows the information to be published once and viewed by many different programs. The user subscribes to a feed by entering the feed's link into the reader or by clicking an RSS icon in a browser that initiates the subscription process. The RSS reader checks the user's subscribed feeds regularly for new content, downloads any updates that it finds, and provides a user interface to monitor and read the feeds.

Online Synchronization FAQ

What is data synchronization?

Online data synchronization is a process that allows businesses to update multiple sources of similar data that are located on multiple servers within a region, a country, or throughout the world. Synchronized data becomes real-time information. Data synchronization updates the data in multiple locations, and also across a variety of network platforms. This ensures that the latest information is readily accessible to those who need it WHEN they need it.

If I hire a data management service, what do I need to know about data synchronization?

You need to learn as much as possible about data synchronization for your business. However, it is not necessary to know the specific details of the day-to-day operations of online synchronization. The synchronization team specializes in data synchronization problems as they arise. They excel in monitoring the data files in your synchronization project, and they handle any issues as they occur.

Is this synchronization free or paid?

It is a paid service.

Do you provide installation service?

Yes we provide installation service for that you are charged a bit.

What do I need to do before my files are submitted for a synchronization request?

Before you submit a database or file into the synchronization process, you will check the configurations for both your source and destination databases. You are also able to select the synchronization of a full database, or only selected files from within a database.

What happens when I submit customized synchronization requests?

Clients can customize a synchronization process that allows updates to rows within your data file that are new, updated with new data, or removed from the database only since the last synchronization.

Is my data safe? Will I lose anything after I submit my data files?

Your data is secure. You do not need to worry about lost or corrupt files during synchronization. Your source files remain untouched during the process. Another feature of data synchronization is the use of XML-RPC, which acts as an encryption software. Upon submission of your data for synchronization, XML-RPC encrypts and converts your updated information until it arrives at the destination location. Once your data update arrives at the remote location, it is reformatted to its original structure.

Because synchronized data plays a vital role in the needs of individual and business data requirements, it makes sense to entrust the synchronization process to a team of professionals who use the latest technologies to manage online data synchronization safely, reliably, and consistently.

A Custom Solution Online Synchronization Script.
Pay Once And Use For Life Time.

Online data synchronization is a safe, effective, and cost-saving approach to data management. Online data synchronization services offer a wide range of data management solutions regardless of the size and complexity of the data structure.
